Q'Max Solutions Inc. (India) has taken initiative in formulating Q'Plug, a chemical precipitating liquid LCM.

A two part LCM pill used for controlling loss circulation in highly permeable or poorly consolidated intervals. The first part of the pill is Q-Activator and second part Q-Terminator. An equal volume of Q-Activator is pumped ahead of Q-Terminator separated by small volume of fresh water. These two parts of pill react and precipitate either in well bore or within formation matrix or fracture. Q-Terminator can be further viscosified for adding fibre material to enhance the bridging properties.
